wbowers@us.ibm.com

Acronyms

- ▶ DCM – Digital Certificate Manager
- ▶ DHCP – Dynamic Host Configuration Protocol
- ▶ FQDN – Fully Qualified Domain Name
- ▶ GbE – Gigabit Ethernet
- ▶ HEA – Host Ethernet Adaptor
- ▶ IVE – Integrated Virtual Ethernet adaptor
- ▶ LACP – Link Aggregation Control Protocol
- ▶ LPAR – Logical Partition
- ▶ PCIe – PCI express (Serial version of PCI)
- ▶ RFC – Request for Comment (IP Standards)
- ▶ REF – Request for Enhancement
- ▶ SR-IOV – Single Root I/O Virtualization
- ▶ SSL – Secure Sockets Layer
- ▶ TLS – Transport Layer Security
- ▶ VIOS – Virtual Input Output Server
- ▶ VLAN – Virtual Local Area Network

- ▶ FUBAR – What to avoid.

Why are we here?

- ▶ Today virtually 100% of data moves in and out of our systems on Ethernet
- ▶ Even old legacy SNA traffic is encapsulated in TCP/IP
- ▶ Our networks continue to get more complicated, and capable.
- ▶ A well performing system can be crippled by poorly done networking.
- ▶ Reliability, redundancy, security: all mandatory in today's environment.
- ▶ If the network is down, the system is gone. To the users, the system IS down!

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Best Practice Overview

- ▶ IBM i has very robust networking components which are written to adhere to the RFCs very closely.
 - This is unlike some other operating systems where many things are discovered later by hackers or badly formed network data.
- ▶ Nonetheless, correct configuration of the components is absolutely necessary to assure reliable and efficient connections.
- ▶ You should NOT be surprised to find that security of the networking components and their configuration plays a huge role in the overall security of your system!

Things to do right.

- ▶ Physical network connections
- ▶ IP Configuration
- ▶ Proper naming
- ▶ Running the right servers
- ▶ Assuring data isn't read along the way
- ▶ Restricting access to the servers

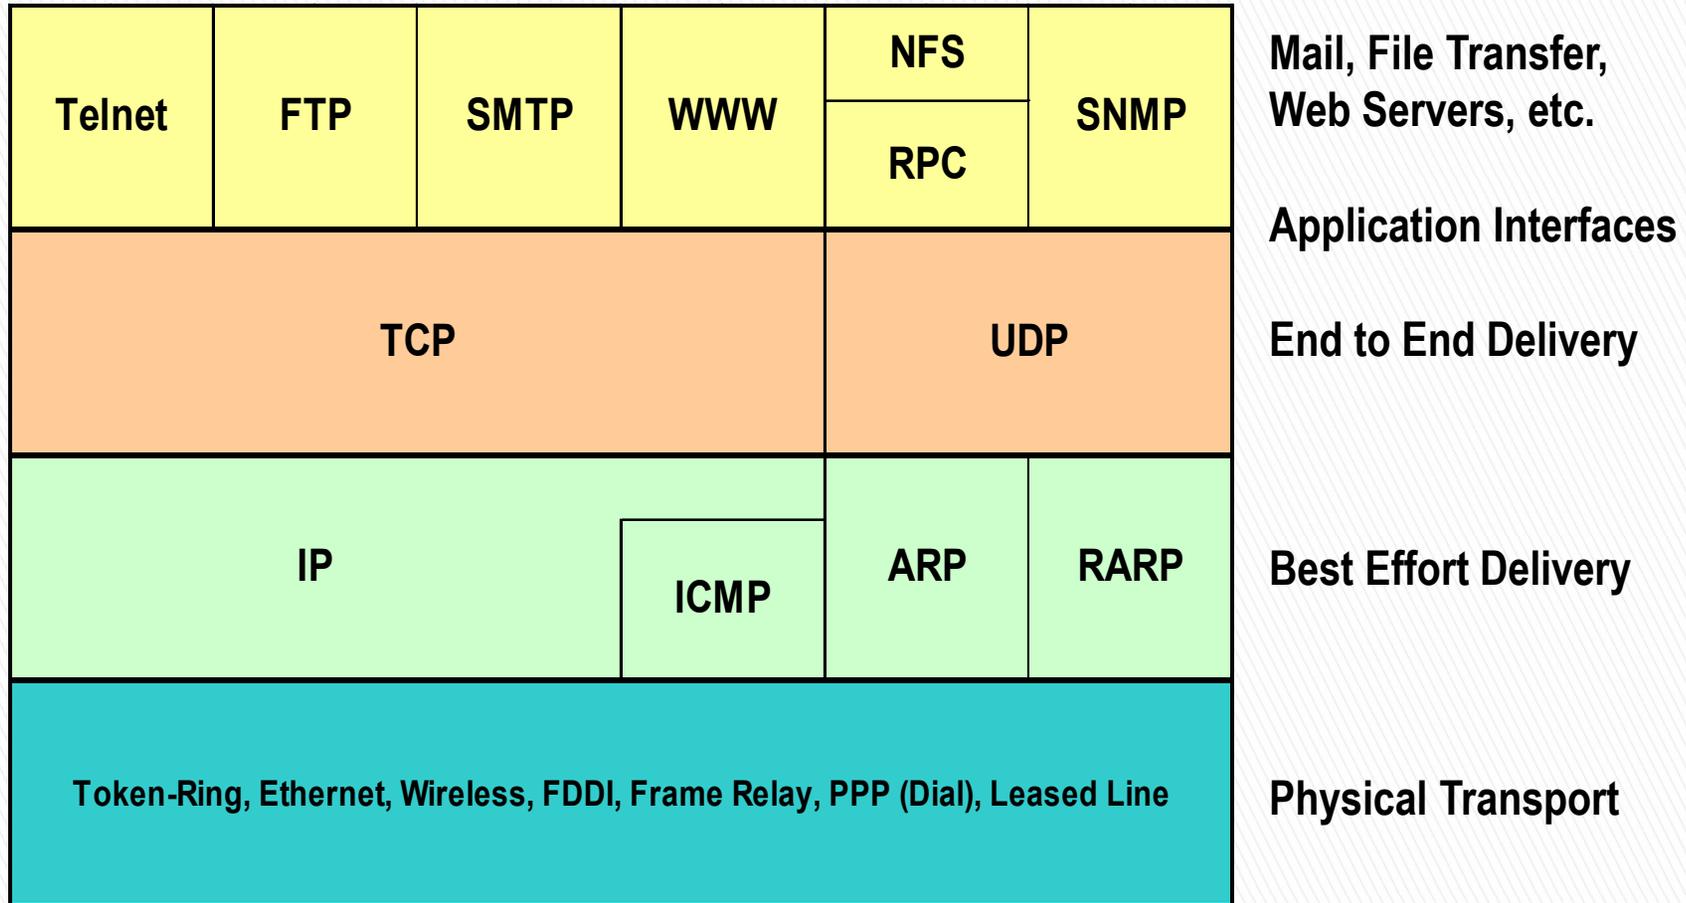

Remember this is in ADDITION to proper:
Authentication (user profiles etc.)
Authorization (permissions and authority)

Basic Networking (in one slide!)

- ▶ Data exists on one system and it needs to get to another system.
- ▶ The system with the data places that data into packets that will fit the network, breaking it into multiple pieces as needed.
- ▶ Header information is added including **destination**, **source**, length and other bits to fill out the packet.
- ▶ Data is almost always placed onto an Ethernet network today.
- ▶ Ethernet then carries the data to the first stop along the network.
 - Ethernet is 'local only' that is it cannot send a packet from Ft. Lauderdale to Chicago.
- ▶ The next stop along the network may be a router which reformats the packet to fit the media used outside your building.
 - This may mean different headers or breaking the packets up
- ▶ This process repeats and repeats until the data reaches its destination.
- ▶ Besides just getting the data there, components of the process can also confirm delivery (TCP)
- ▶ Where is IP in all of this? It's inside the 'Data' portion of the Ethernet packets!

Communication Stack

IP - Internet Protocol

ICMP - Internet Control Message Protocol

ARP - Address Resolution Protocol

RARP - Reverse Address Resolution

Protocol

TCP - Transmission Control Program

UDP - User Datagram Protocol

Telnet - Teletype Network

FTP - File Transfer Protocol

SMTP - Simple Mail Transfer Protocol

WWW -World WideWeb

NFS - Network File System

RPC - Remote Procedure Call

SNMP - Simple Network Management Protocol

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Defining the connection from IBM i

- ▶ Ethernet runs over many different adapters
 - From 10Mb to 100Gb
- ▶ They can be dedicated, shared or virtual
- ▶ CRTLINETH is used to define the connection to the physical hardware from IBM i.
- ▶ Several things are key on the line description if you want it right.
 - A good naming convention so you know which is which
 - The CMNnn resource name(s) for your Ethernet hardware
 - TEXT so you'll know what the line is for!!
 - Seriously don't say "Ethernet Line" (face palm)

Reliability enhanced

- ▶ Use of good cables is a must, not homemade cables, especially with GbE and up.
 - Cat6e minimum, Cat6a is better, Cat7 an option.
- ▶ Assure the retention tab isn't broken off
 - Using one successfully completes the application for 'worst practices in systems management' 😊
- ▶ LABEL cables on BOTH ends
 - BOTH ends should specify BOTH ends!
- ▶ Secure cables in place all the way to the network switches.
- ▶ Internally document the port's use at the switch to prevent mistakes by the network knuckleheads.
- ▶ If using LAN Console it must use T1 port, consider leaving a T1 port open for console failure

Redundancy

- ▶ Redundancy is nearly mandatory these days
- ▶ Connect a second line, even third if you'd like.
- ▶ The second line should come from a separate Ethernet IOA if at all possible.
 - On a separate bus is better
 - In a separate I/O drawer is better still
 - A third line is even better!
- ▶ If possible connect to a separate network switch as well.

Redundancy Options:

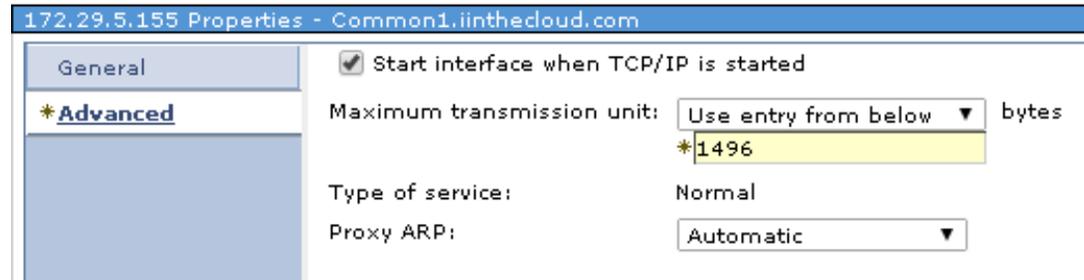

- ▶ Virtual IP redundancy or Link Aggregation.
 - Supported on all current releases
 - Virtual IP with Proxy ARP
 - Redundancy by floating IP between multiple Ethernet lines
 - Link Aggregation
 - Multiply bandwidth by binding multiple lines together.
 - Redundancy by maintaining connectivity as long as one line stays active.
 - Or do Both!
 - Create two aggregated links
 - Use Virtual IP support to put both aggregated links in play.

Steps to set up Virtual IP

- ▶ Configure a second Ethernet line (or more as desired)
- ▶ Obtain one additional IP address for each Ethernet line to be used
 - These are in addition to existing production IP address(es)
 - These addresses must all be in the same IP Subnet
 - Assign the new addresses to each line.
 - Assure that the 'Associated Local Interface' is set to the current production address.
- ▶ Stop the production address and delete it.
- ▶ Recreate the production address as a virtual IP interface
 - IMPORTANT remember to set the MTU for the production address to match that for the Ethernet lines.
 - The default is 576!
- ▶ Repeat for each current production address.

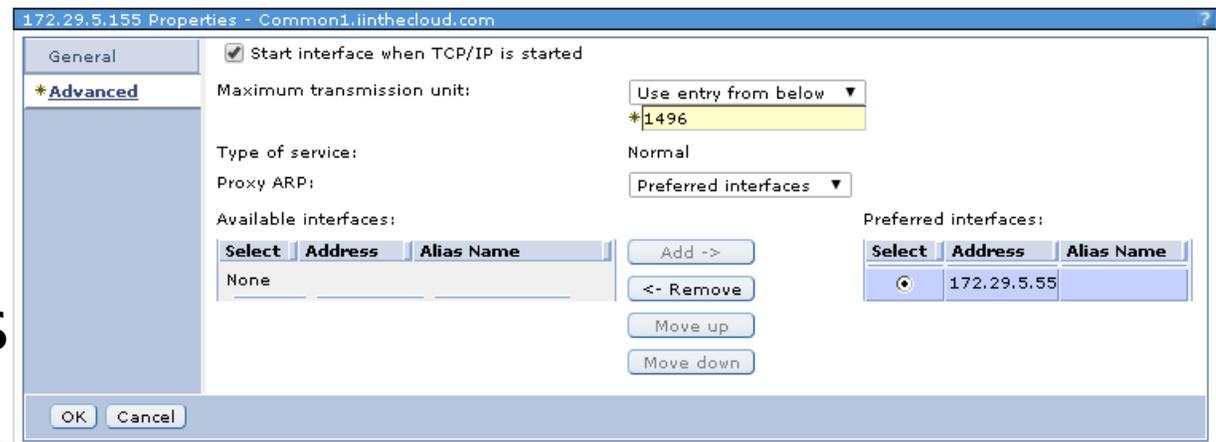

Setting Frame size & Proxy Arp

▶ Here we set the Maximum Frame Size to match Smallest line value.

▶ For Proxy ARP set either Automatic or 'Preferred interface' which displays below:

▶ Here we select the preferred line by selecting its IP address

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Link Aggregation overview

- ▶ Traditionally we connect one Ethernet cable from a switch to an Ethernet adapter for each partition.
 - The speed of this has gone up 10Mb, 100, 1000 (GbE), and now even 10,000Mb (10 GbE) with fiber.
 - Problem was if it fails for ANY reason, speed goes to *ZERO.
- ▶ We have had redundancy since V5R3 with virtual IP addresses.
- ▶ Aggregation allows us to logically combine up to 8 physical lines into one logical 'channel'

Link Aggregation Detail

- ▶ Aggregation enables multiple physical connections to appear as one physical line.
 - Speed is the accumulation of the physical lines less some overhead.
 - As long as at least one of the physical lines remains linked the line remains up and functional.
- ▶ Configuration of both ends (IBM i and your network switch) is required.

The IBM i side of the config

- ▶ For must be done at the command line.
- ▶ Identify the CMN numbers of each of the physical interfaces to be aggregated.
 - Rules:
 - All Interfaces must be GbE Capable and full duplex
 - All Interfaces must run at the same speed
 - e.g. you can aggregate a 1Gbe and a 10Gbe line but both must be at 1Gbe so this would not be a normal configuration.
- ▶ When the Ethernet line is created specify *AGG instead of a CMN resource then list all CMN resources in the Aggregated Resource list.

Verify your Link Agg

▶ DSPLIND LIND(ETHERAGG1) OPTION(*AGGRSCL)

```
Line description . . . . : ETHERAGG1
Option . . . . . : *AGGRSCL
Category of line . . . . : *ELAN
```

-Aggregated Resource List--

Name	Status	
CMN73	LINK UP	<- Link 1 up
CMN76	LINK UP	<- Link 2 up

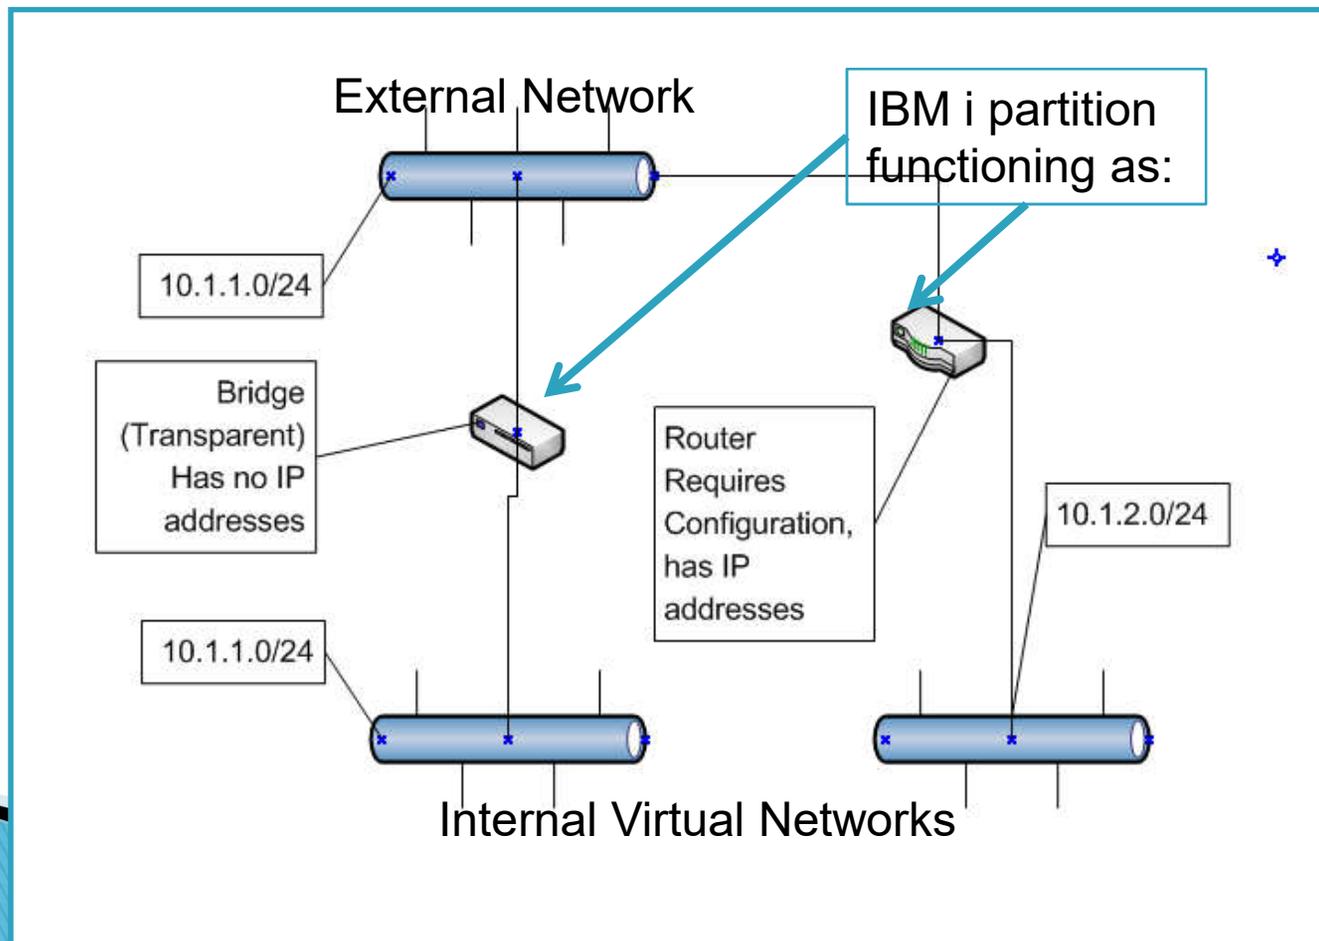

Using the Aggregated line

- ▶ The line can be used for any use that a typical GbE line can.
- ▶ IP interfaces can be added to the line
- ▶ The line can be used in a bridge
- ▶ If one of the physical lines does not come up it will *not* come up until the line is varied off and back on.
- ▶ A new resource will appear for each aggregation line under a 6B26 communications adapter.
 - Named AGG01, 02 etc.
 - This resource is NOT valid to be used
 - It may disappear if the line description is deleted

Are you Routing or Bridging?

- ▶ Key differences are configuration and protocol support.

Validate the bridge status

- ▶ Check the status with `WRKCFGSTS *LIN`

```
Work with Configuration Status                V7R1PROD
                                           02/19/12  16:59:25

Opt  Description          Status
___  BRIDGE_E             VARIED ON
___  BRIDGE_I             VARIED ON
```

- ▶ Both lines should be **VARIED ON**.
 - They will never go “ACTIVE”

Bridging – best practice

- ▶ The external Ethernet line can be an aggregated line or a standard line.
- ▶ The Ethernet lines used for bridging should NOT have IP addresses configured on them.
 - This is because in promiscuous mode many more packets hit this interface and this causes significant overhead for identifying and then processing the IP Packets.
- ▶ If there are any controllers on these lines you have a problem and that must be remedied!
- ▶ Bridging is NOT valid on HEA adapters.
- ▶ Tracing a bridge line will trace all packets handled by the bridge (As well as packets handled by IP if you violate rule 1 above!)

IBM i and VLANs

- ▶ Until 7.2 IBM i itself did not recognize an 802.1Q VLAN tag.
- ▶ Previous to i 7.2 the switch port on which IBM i is connected has be an ‘access’ port.
 - This means that the switch does any tagging and un-tagging of packets.
 - IBM i is unaware of the VLAN it is connected to.
 - i 7.2 still supports this of course!

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Further addressing

- ▶ IBM i supports many IP addresses on a system and many on a single Ethernet line.
- ▶ Separate IP addresses are useful for many things:
 - Individual Web servers or services
 - Multiple Domino servers
 - Different interfaces to separate user traffic and replication traffic such as PowerHA or Mimix.
- ▶ BUT just because you can..... 😊
 - Understand what each address is needed for.
 - Document what they are for TEXT Parameter!!
 - Remove unused addresses

Best practices – Interfaces

- ▶ Do not add more interfaces than are needed on your server.
- ▶ Best practice is also to keep IP addresses that are on different subnets on different Ethernet lines.
 - With i 7.2 forward this may be separate VLANs sharing a physical interface.
- ▶ Multiple IP addresses in the *same* subnet should all be VIPs leaving one interface (IP address) that is not virtual.
 - First reason is that traffic sourced from IBM i will appear to come from the IP address physically associated with the line.
 - Knowing this may simplify firewall rules especially for partners on the far side of restricted links.
 - Second is that when you STRTCPIFC for a virtual IP address the system will gratuitously ARP the address in the network.
 - This means that if you are moving a service between servers for instance that everyone in the local network will know immediately.
 - With an IP tied to a physical line, ARP caches must time out.

More on Interfaces

- ▶ IP Interfaces can now be referred to by an Alias name.
 - This is an excellent thing to do for multiple reasons.
 - 1) Changes to IP addresses no longer necessitate changes to startup, shutdown, and failover scripts.
 - 2) Scripts can be the same on production and backup servers but they'll still bring up the correct address for the system at that location.
 - 3) The name serves as additional documentation

Best Practices – Routing

- ▶ Do:
 - Point all routes at hosts (routers) on the local network!
 - Keep the list short
 - Let your routers do the routing. (It's what routers do best!)
- ▶ Don't:
 - Add Host routes covered by Network routes
 - Add Network routes covered by Default routes
 - Lie to your system!
- ▶ Notes:
 - IBM i will NOT reply to a host if it does not have a route to that host
 - Some other OSs will reply back via the route the traffic came from
 - You should recognize this as a security problem!

Types of Routes

- ▶ Direct Routes (consulted first)
 - Added by the system to the local network
- ▶ Host Routes (consulted second)
 - Specify a route to a specific Host
- ▶ Network Routes (consulted third)
 - You may add your own routes to the local network, called 'Schowler Routes'
 - These replace the system added Direct routes
 - Specify a route to a network of Hosts
 - Many of these can be added
 - Duplicates ARE allowed
- ▶ Default Route (consulted last)
 - Specify routers to be used when no Host or Network routes match

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

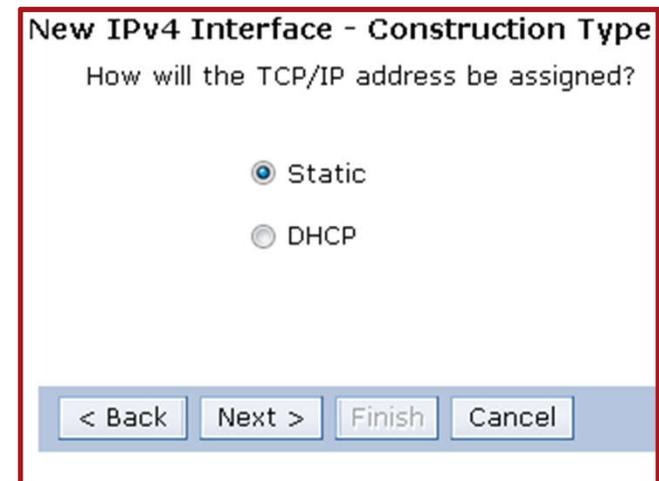

Using VLANs in IBM i

- ▶ Configure a switch port as a Trunk
 - VLAN tags are only allowed on Trunk Ports.
- ▶ Connect this port to a physical IBM i port.
- ▶ Configure a standard Ethernet line for this physical port.
 - If needed this can be an aggregated line.
- ▶ Using ADDTCPIFC or IBM Navigator for i (Not System i Navigator!) add the interface to the line and enter the VLAN number.

Creating an interface on a VLAN

- ▶ First select Actions and new Interface, then LAN
- ▶ Omitted is selection for Ethernet, Token-Ring, or Opticonnect (Pick Ethernet!)
- ▶ In this case we're doing a standard static IP address
- ▶ Next select the Ethernet line you will be placing the line on.

Creating an Interface on a VLAN

- ▶ Selected 'use entry from below' to use a VLAN.
- ▶ Enter the VLAN number, here VLAN ID of 294.

- ▶ Enter the IP Address and Subnet Mask

- ▶ Alias, Description and MTU work as with any interface

System i Navigator

New IPv4 Interface - Settings

What are the settings for this TCP/IP interface?

Line Name: ETHTRUNK1

VLAN ID: Use entry from below (None, 1 - 4094)
294

*IP address: 172.29.4.218

*Subnet mask: 255.255.255.0

Alias name: VLAN294

IBM i Enhanced networking and troubleshooting

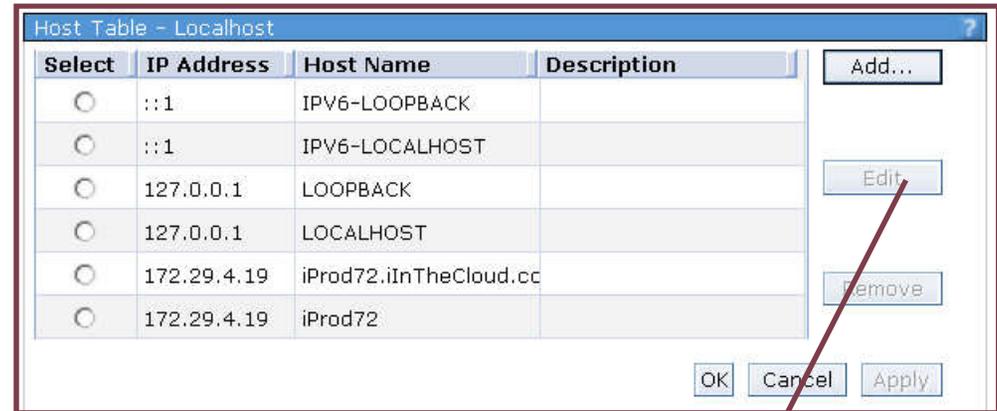

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Who am i?

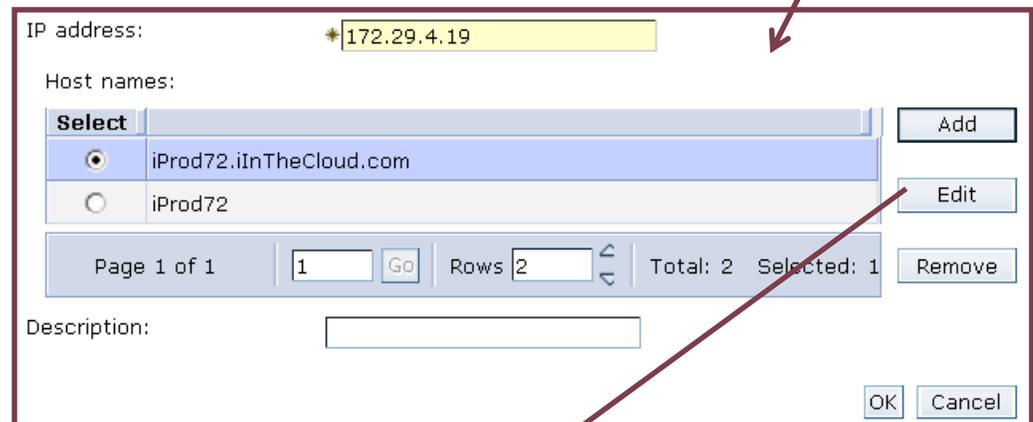

- ▶ IBM i and many servers that run on it must know who they are.
 - Prompt CHGTCPDMN to see your system's name.
 - Combine the 'Host Name' and the 'Domain Name' for your system's full name.
 - Now resolve that name to an IP address.
 - That IP address needs to be an active Interface on your system.
 - Also a good idea to resolve the IP address to verify that it resolves back to the system name from CHGTCPDMN.
 - Some of you cheaters will put that entry in the hosts table (CFGTCP option 10 on i) but I prefer DNS myself.

Host Table Settings.

- ▶ Network → All Tasks → Manage Host Table
- ▶ Can enter many names per address now. (Previously the limit was four per IP interface)
- ▶ Can enter both IPV4 and IPV6 names in the table.
- ▶ With the Edit option you get the panel below.
- ▶ Note the ability to change the IP associated with the names.
- ▶ Further you can edit the name itself.

Select	IP Address	Host Name	Description
<input type="radio"/>	::1	IPV6-LOOPBACK	
<input type="radio"/>	::1	IPV6-LOCALHOST	
<input type="radio"/>	127.0.0.1	LOOPBACK	
<input type="radio"/>	127.0.0.1	LOCALHOST	
<input type="radio"/>	172.29.4.19	iProd72.iInTheCloud.cc	
<input type="radio"/>	172.29.4.19	iProd72	

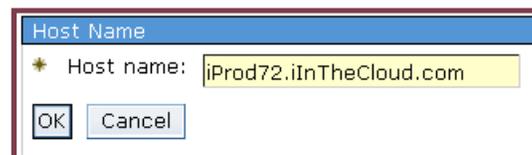

IP address: 172.29.4.19

Host names:

* Host name: iProd72.iInTheCloud.com

TCP/IP Attributes

- ▶ Network -> All Tasks -> TCP/IP Configuration - TCP/IP Attributes.
- ▶ There are four tabs available. General Below.
- ▶ If this system is routing or doing Proxy Arp then IP Datagram Forwarding must be checked.
- ▶ Dead gateway detection checks to see if routers are available and disables routes where they are not.

A screenshot of the 'TCP/IP Attributes' dialog box, showing the configuration for the 'General' tab. The settings are as follows:

- IP datagram forwarding
- IP source routing
- Log protocol errors
- Path MTU discovery interval: Default (minutes (5 - 40320))
- IP QoS Enablement: No
- Dead gateway detection: Yes
- Detection interval: 2 (minutes (1 - 60))
- Enable network file cache: Clear Cache
- Cache size: 10 (megabytes (10 - 100000))
- Cache timeout interval: 5 (minutes (30 seconds - 7 days))
- DHCP unique identifier: Pending (Generate)

TCP/IP Attributes, transports tab

- ▶ Settings here for such as:
- ▶ Keep alive timer
- ▶ Receive and Send buffer sizes
 - Note that from i 6.1 the defaults were increased so you may have smaller values here if you got here via Upgrade vs Install

TCP keep-alive time:	<input type="text" value="120"/>	minutes (1 - 40320)
TCP urgent pointer convention:	<input checked="" type="radio"/> BSD <input type="radio"/> RFC	
TCP receive buffer size:	<input type="text" value="65535"/>	bytes (512 - 8388608)
TCP send buffer size:	<input type="text" value="65535"/>	bytes (512 - 8388608)
TCP R1 retransmission value:	<input type="text" value="3"/>	(1 - 15)
TCP R2 retransmission value:	<input type="text" value="16"/>	(2 - 16)
TCP minimum retransmission timeout:	<input type="text" value="250"/>	milliseconds (100 - 1000)
TCP time-wait timeout value:	<input type="text" value="120"/>	seconds (0 - 14400)
<input checked="" type="checkbox"/> UDP checksum		
<input type="checkbox"/> Enable explicit congestion notification (ECN)		
<input checked="" type="checkbox"/> Send messages for abnormal TCP connection termination		
<input checked="" type="checkbox"/> Limit messages to one per minute		

Note also that these are just starting points.

TCP Attributes

- ▶ If there is no reason for your system to act like a router then:
 - CHGTCPA IPDTGFWD(*NO)
 - This stops the system from forwarding any packets
- ▶ If you use connections to remote sites:
 - CHGTCPA TCPRCVBUF(65536) TCPSNDBUF(65536)
 - This increases the buffers for send and receive
- ▶ If you are annoyed by lots of messages in QSYSOPR about connections closing:
 - CHGTCPA TCPCNNMSG(*NONE)
 - This tells the system not to send those messages

IBM i Enhanced networking and troubleshooting

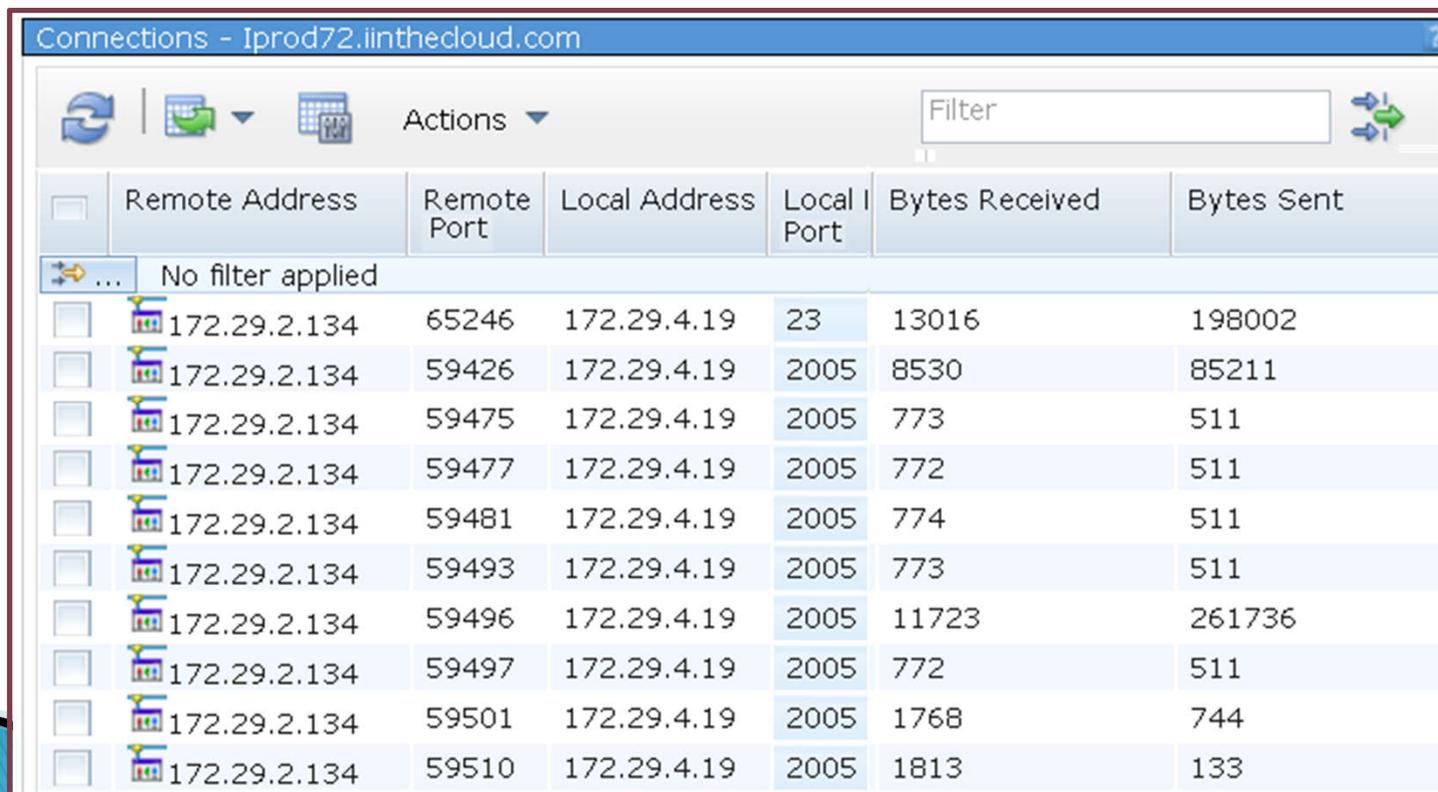

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Who's talking to my system?

- ▶ It's not a bad idea to check the connections to your system.
- ▶ You may see huge data transfers or connections from addresses you don't recognize.
- ▶ You may see open ports listening that you are not aware of and should take action on.
- ▶ There are options on green screen and Navigator for i.
 - NETSTAT *CNN on command line
 - Network -> TCP/IP Configuration -> IPv(n) -> Connections

IP Connections

- ▶ Much can be learned about who's connecting!
- ▶ Can sort by columns, can select columns.
- ▶ Can Filter quickly as well

The screenshot shows a window titled "Connections - Iprod72.iinthedcloud.com". It features a toolbar with icons for refresh, filter, and actions, along with a search box labeled "Filter". Below the toolbar is a table with columns for Remote Address, Remote Port, Local Address, Local Port, Bytes Received, and Bytes Sent. The table contains 10 rows of data, all with a Remote Address of 172.29.2.134. The Local Port column is sorted in ascending order.

	Remote Address	Remote Port	Local Address	Local Port	Bytes Received	Bytes Sent
...	No filter applied					
<input type="checkbox"/>	172.29.2.134	65246	172.29.4.19	23	13016	198002
<input type="checkbox"/>	172.29.2.134	59426	172.29.4.19	2005	8530	85211
<input type="checkbox"/>	172.29.2.134	59475	172.29.4.19	2005	773	511
<input type="checkbox"/>	172.29.2.134	59477	172.29.4.19	2005	772	511
<input type="checkbox"/>	172.29.2.134	59481	172.29.4.19	2005	774	511
<input type="checkbox"/>	172.29.2.134	59493	172.29.4.19	2005	773	511
<input type="checkbox"/>	172.29.2.134	59496	172.29.4.19	2005	11723	261736
<input type="checkbox"/>	172.29.2.134	59497	172.29.4.19	2005	772	511
<input type="checkbox"/>	172.29.2.134	59501	172.29.4.19	2005	1768	744
<input type="checkbox"/>	172.29.2.134	59510	172.29.4.19	2005	1813	133

Network Auditing

- ▶ QAUDLVL/QAUDLVL2
 - *NETBASE – Network base tasks
 - *NETFAIL – Network failure
 - *NETCLU – Network cluster tasks
 - *NETSCK – Network socket tasks
 - *NETCMN – Composes of *NETBASE, *NETFAIL, *NETCLU & some of *NETSCK (only r7.3)
 - *NETTELSVR – Telnet server connections (only r7.3)
 - *NETSECURE – Secure network connections (only r7.3)
 - *NETUDP – UDP traffic (only r7.3)

Communications Traces

- ▶ You can also use Communications Traces
- ▶ Collect the data and then export it.
- ▶ Export options include .pcap files which are compatible with Wireshark and other packet capture software.
- ▶ Can also print the traces as well.
- ▶ This can give lots more detail and in fact can give too much detail!!

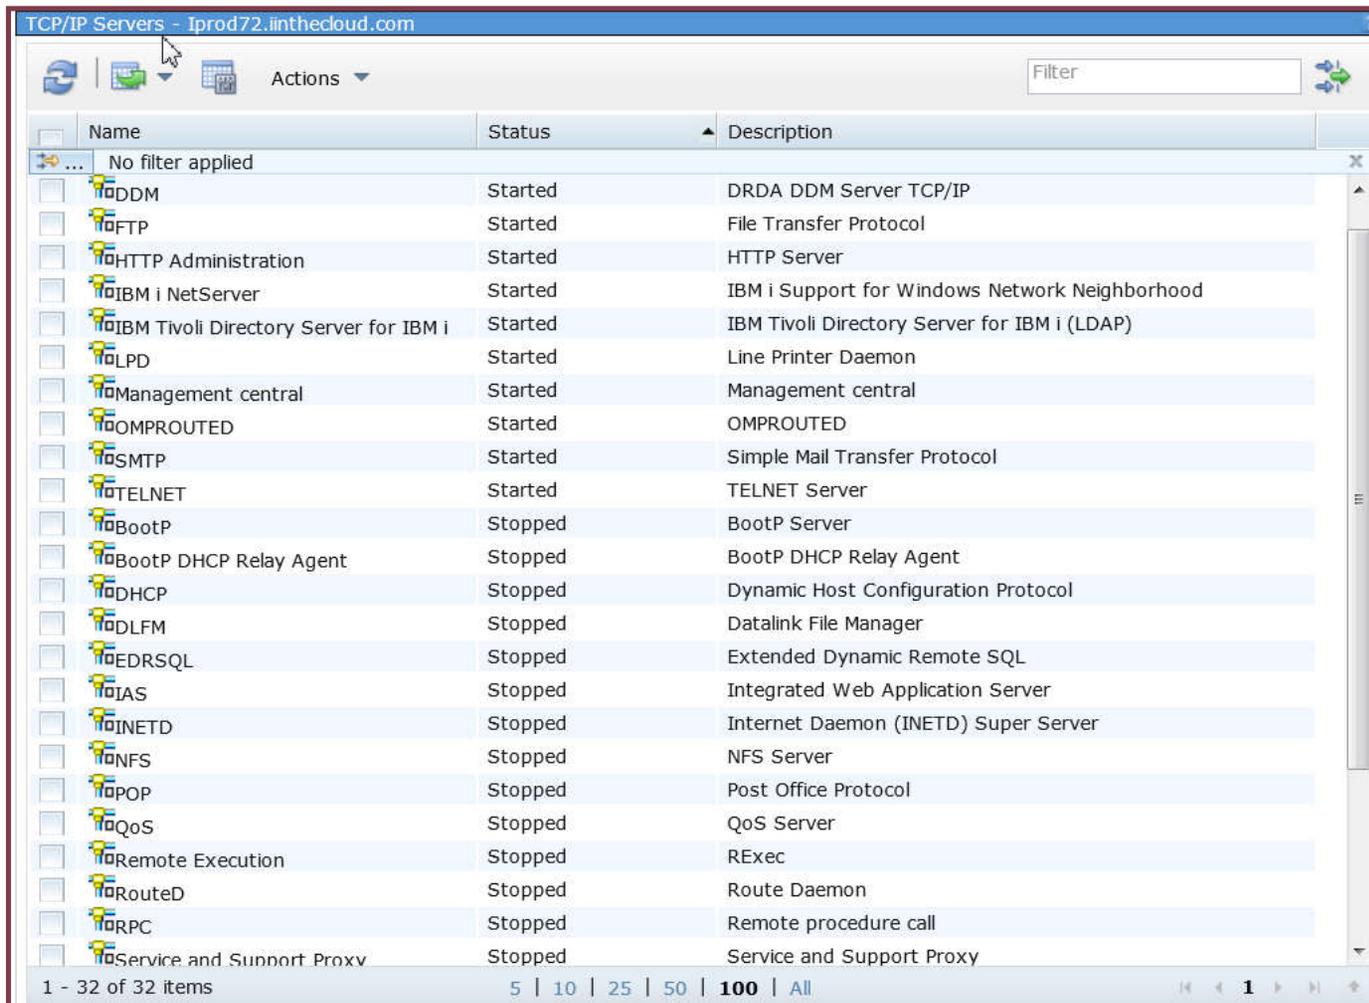

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Which is right to Run??

- ▶ We cannot tell you which servers to start!
- ▶ We can suggest some that we think need to be running but your company's use of the system is what dictates these choices.
- ▶ What we CAN tell you is that running services that are not needed is a bad idea.
 - They consume some resources.
 - They open potential attack vectors to your system.
- ▶ Know that you don't need the server side running to use the client.
 - For example the FTP server does not need to be running for you to use the FTP command on IBM i to send or receive files.
- ▶ Understand that there are two ways to start the IP Servers!

TCP/IP – Servers

The screenshot shows a web-based management interface for TCP/IP servers. The title bar reads "TCP/IP Servers - Iprod72.inthecloud.com". The interface includes a toolbar with icons for refresh, home, and actions, and a search filter box. Below is a table listing 32 servers, each with a checkbox, name, status, and description.

<input type="checkbox"/>	Name	Status	Description
<input type="checkbox"/>	No filter applied		
<input type="checkbox"/>	DDM	Started	DRDA DDM Server TCP/IP
<input type="checkbox"/>	FTP	Started	File Transfer Protocol
<input type="checkbox"/>	HTTP Administration	Started	HTTP Server
<input type="checkbox"/>	IBM i NetServer	Started	IBM i Support for Windows Network Neighborhood
<input type="checkbox"/>	IBM Tivoli Directory Server for IBM i	Started	IBM Tivoli Directory Server for IBM i (LDAP)
<input type="checkbox"/>	LPD	Started	Line Printer Daemon
<input type="checkbox"/>	Management central	Started	Management central
<input type="checkbox"/>	OMPROUTED	Started	OMPROUTED
<input type="checkbox"/>	SMTP	Started	Simple Mail Transfer Protocol
<input type="checkbox"/>	TELNET	Started	TELNET Server
<input type="checkbox"/>	BootP	Stopped	BootP Server
<input type="checkbox"/>	BootP DHCP Relay Agent	Stopped	BootP DHCP Relay Agent
<input type="checkbox"/>	DHCP	Stopped	Dynamic Host Configuration Protocol
<input type="checkbox"/>	DLFM	Stopped	Datalink File Manager
<input type="checkbox"/>	EDRSQL	Stopped	Extended Dynamic Remote SQL
<input type="checkbox"/>	IAS	Stopped	Integrated Web Application Server
<input type="checkbox"/>	INETD	Stopped	Internet Daemon (INETD) Super Server
<input type="checkbox"/>	NFS	Stopped	NFS Server
<input type="checkbox"/>	POP	Stopped	Post Office Protocol
<input type="checkbox"/>	QoS	Stopped	QoS Server
<input type="checkbox"/>	Remote Execution	Stopped	RExec
<input type="checkbox"/>	RouteD	Stopped	Route Daemon
<input type="checkbox"/>	RPC	Stopped	Remote procedure call
<input type="checkbox"/>	Service and Support Proxy	Stopped	Service and Support Proxy

1 - 32 of 32 items 5 | 10 | 25 | 50 | 100 | All

**Network ->
Servers ->
TCP/IP Servers**

**Check the box
and select
Actions for the
menu.**

**Sequence is
started/stopped
here.**

- ▶ This is the list of TCP/IP Servers included in IBM i
- ▶ Nearly all of them can be maintained from here

Servers to Start

- ▶ Network→All Tasks→TCP/IP Configuration→TCP/IP Configuration Properties.
 - Then click the Servers to Start tab on the left.
- ▶ Here are all the servers and a check box to start at IPL or not for each.
- ▶ Note the scroll bar or you can change the rows field.
- ▶ CHGxxxA on the command line can set this also.

Select	
<input type="radio"/>	<input type="checkbox"/> BootP
<input type="radio"/>	<input checked="" type="checkbox"/> Central
<input type="radio"/>	<input checked="" type="checkbox"/> DDM
<input type="radio"/>	<input type="checkbox"/> DHCP
<input type="radio"/>	<input type="checkbox"/> DLFM
<input type="radio"/>	<input type="checkbox"/> DNS
<input type="radio"/>	<input checked="" type="checkbox"/> Data Queue
<input type="radio"/>	<input checked="" type="checkbox"/> Database
<input type="radio"/>	<input type="checkbox"/> EDRSQL
<input type="radio"/>	<input checked="" type="checkbox"/> FTP

TCP Startup

- ▶ We mentioned there is more than one way to start IP Servers.
 - By default they will start with the STRTCP command if the boxes show prior are checked.
 - ***BUT*** many systems have custom startup jobs and if you have one of those you **MUST** verify startup in that process!
- ▶ Most of you likely don't use IPV6!
 - It's a very good idea then to **NOT** start IPV6.
 - Several things add delays attempting to prefer IPV6 when it's available. This is bad.
 - If your startup is set CHGIPLA STRTCP(*YES) Then:
 - CHGCMDDFT STRTCP NEWDFD('STRIP6(*NO)')
 - If you have a custom startup program that starts IP:
 - STRTCP STRIP6(*NO)
- ▶ CHGIPLA STRTCP(*NO) if you want to control all aspects of starting IP at IPL time.
 - Do not duplicate starts of TCP or Servers in IPL/TPC attributes and startup program. Choose an approach and stick to it!

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Can you see my data?

- ▶ Do you know how much a good sniffer program costs for your average Windows machine? How about Linux?
 - Correct, \$FREE
- ▶ That means for, um, nothing a user on your network could be watching a huge amount of data go by AND capture it.
 - In there are some pretty curious things such as, oh, user IDs and Passwords in there.
- ▶ Given the vast majority of hacks on computers are from the inside, that should make you go, Hmmmmm. (At the very least!)

How do I stop sniffers?

- ▶ Clearly every security defense is layers.
- ▶ One layer is to keep people off the networks that have sensitive information.
 - That usually means different VLANs for different types of traffic.
 - If you're not on that network then you cannot see that data.
- ▶ Another layer is to apply encryption to the data.
 - This way even if you are on that network you still can't read the data.
 - You CAN Capture it still but because it is encrypted it is of little to zero use to you.

Network Encryption

- ▶ Nearly every server on IBM i supports encryption.
 - This includes their client counterparts as well.
- ▶ To enable encryption a set of keys must be installed, trusted, and assigned to each server or client that needs them.
 - These keys, otherwise known as certificates, can be:
 - Created by a private authority such as the one built into IBM i DCM
 - Purchased from a trusted third party such as Verisign, GoDaddy, or many others.
 - Whether you choose private or third party depends on your users and type of connections.

Encryption considerations

- ▶ Larger keys are more secure.
 - They also take more CPU power to do said encryption
 - We are OK with this as we like selling more hardware!
 - Of course you may not be, so it's recommended to avoid keys over 2048 bits at this time.
 - Cryptographic co-processors are available to offload the encryption and decryption effort.
- ▶ Trusted third party keys have the advantage of not causing 'pink eye' and nasty browser messages recommending that you 'go back to safety' or 'don't go there!'
 - Your data is no more secure but people will be more likely to believe you!

Encryption considerations

- ▶ SSL Naughty List
 - SSLv2 Protocol
 - RFC 6176 - Prohibiting SSLv2
 - SSLv3 Protocol
 - Deprecating SSLv3 - draft-thomson-sslv3-diediedie-00
 - Known for many years to be vulnerable
 - POODLE attack in 2014 finally resulted in widespread disabling
 - RC4 Ciphers
 - Prohibiting RC4 Cipher Suites - draft-ietf-tls-prohibiting-rc4-01 (RFC soon)
 - MD5 Ciphers
 - Issues known for a long time. 2004 it was no longer theoretical
 - 3DES Ciphers
 - IBM i OS PTFs removed
 - Certificates with 1024-bit RSA keys
 - NIST said stop using it by end of 2013
 - Certificates with SHA-1 signatures
 - Chrome will flag as not secure by Jan 2017

Packet Filters

- ▶ What do you do when you do need a specific server or client connection that you otherwise wouldn't want to be available?
 - Perhaps it doesn't support TLS?
 - Or it just doesn't shouldn't be available to others.
- ▶ IBM i Supports the use of Packet Filters to restrict inbound and outbound connections.
- ▶ Packet filters enable you to restrict connections to and from IP addresses, ports, and transport types (TCP/UDP)

Managed through Navigator for i.

- ▶ Access via Network → IP Policies
→ Packet Rules

- ▶ Then select the Rules Editor

- ▶ FILTER SET MONET ← Set Name

ACTION = DENY

DIRECTION = OUTBOUND

DSTADDR <> 172.29.255.1

SRCADDR = * ← * = any

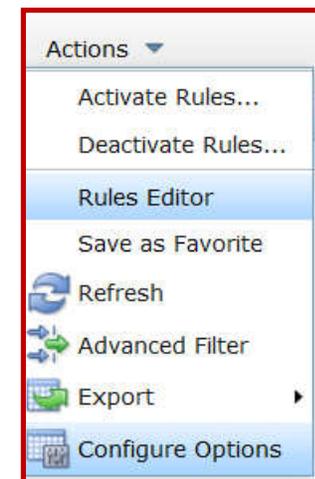

PROTOCOL = TCP ← also UDP, ICMP

DSTPORT = * ← * = any

SRCPORT = * ← can specify port

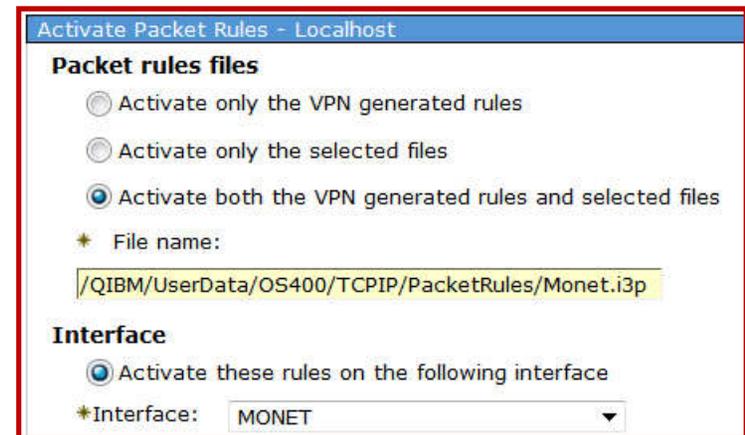

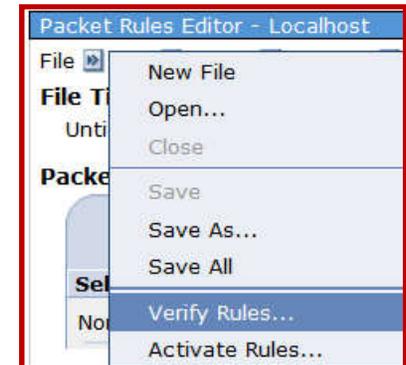

JRN = OFF ← No Journaling

- ▶ FILTER_INTERFACE LINE = MONET SET = MONET

Activating Packet Filters

- ▶ First verify the packet rule
 - A bit like a compile it tells you about your mistakes. 😊
- ▶ Finally activate the rules.
 - Can be on one OR multiple lines.
- ▶ From the command line: LODIPFTR
 - Option to *LOAD or *UNLOAD
 - Indicate line or *ALL
 - Name stream file as below right
- ▶ Remember the Foghorn Leghorn command:
RMVTCPTBL *ALL

IBM i Enhanced networking and troubleshooting

- ▶ Best Practice Overview
- ▶ Defining the Connection
- ▶ Redundancy options
- ▶ Best Practices Addressing and Routing
- ▶ IBM i and VLANs
- ▶ Proper system identification and settings
- ▶ Reviewing current connections
- ▶ Running the right servers
- ▶ Preventing data leakage
- ▶ Staying Current

Oopsie IBM Made a boo boo!

- ▶ OK or maybe an RFC was added or changed.
 - There are more than 7,000 of them dating back to 1980 so what are the odds???
- ▶ How do you fix that?
- ▶ PTFs!
 - It is critical in this day and age to keep PTFs up to date.
 - IBM Supplies a TCP PTF Group for this purpose
 - HIPER PTFs often include these as well and also include the Security PTFs as well.
- ▶ These updates could be for security, performance, reliability, new function (e.g. bridging and link aggregation) and to actually fix things as well.

Key Points to Take Home

- ▶ IBM i IP and Communications Support is full and rich
- ▶ All pieces are included in IBM i for \$free
- ▶ Understanding your configuration and the system's capabilities will help assure that you get the most from your system
- ▶ Redundant connections will help keep the most reliable server out there available to your users
- ▶ Aggregated links enable additional throughput as well as a different type of redundancy.
- ▶ Starting only the right servers helps lower overhead and prevent unwarranted access.
- ▶ Encrypting your data helps prevent it from getting into the wrong hands.
